

HOUSEHOLD PREFERENCES, INSTITUTIONAL FEEDBACK, & PATTERNS IN

TRANSITIONAL HOUSING FOR ADAPTIVE FLOOD RECOVERY

A COMPARATIVE NORTH-SOUTH STUDY OF PAKISTAN AND NORWAY

“

*To investigate how **adaptive planning and human-centered design** can be integrated to strengthen transitional housing recovery and resilience across contrasting governance contexts.*

”

01. *Theoretical Frameworks*

02. *Methodological Choices*

03. *Analytical Process & Stakeholder Involvement*

RESEARCH PROBLEM

Flood recovery is a complex and non-linear process shaped by:

- Climate uncertainty
- Evolving social needs
- Institutional complexity
- Recovery delays
- Changing household adaptation strategies

Existing recovery approaches often:

- ✗ Prioritize technical solutions
- ✗ Underrepresent lived experiences
- ✗ Lack continuous feedback mechanisms
- ✗ Produce limited adaptive capacity

Transitional housing recovery becomes more adaptive and socially sustainable when governance systems continuously integrate household knowledge through human-centered design processes.

The North-South comparison further demonstrates:

- **Adaptive planning without meaningful participation risks technocratic recovery.**
- **While community adaptation without institutional support risks long-term vulnerability.**

Therefore, bridging adaptive planning and human-centered design becomes essential for resilient transitional housing systems.

COMPARATIVE MIXED-METHODS SEQUENTIAL DESIGN

RESEARCH PROCESS

METHODOLOGICAL LOGIC

	Mixed Methods	Captures measurable and lived realities
	Comparative Design	Identifies transferable and context-specific mechanisms
	Sequential Design	Findings from one phase inform the next
	HCD Integration	Moves beyond consultation toward co-design
	Regression + Cluster Analysis	Explain relationships and adaptation typologies
	Thematic Analysis	Enables systematic governance comparison

METHODOLOGICAL JUSTIFICATION MATRIX

	RESEARCH PHASE	SELECTED METHOD	WHY SELECTED?	ANALYTICAL METHOD	WHY NOT ALTERNATIVES?
	Context & Policy Mapping	Policy Analysis + Document Review	Understand governance systems, housing policies, climate adaptation frameworks	Content Analysis	Case study only = limited triangulation; document review alone cannot explain implementation
	Household Recovery Assessment	Stratified Purposive Survey	Capture diverse recovery experiences and measurable comparison	Descriptive Statistics, Cross-tabs, Regression, Cluster Analysis	Random sampling may underrepresent vulnerable groups; qualitative-only lacks comparability
	Governance & Institutional Learning	Semi-Structured Interviews	Explore coordination, participation, trust, flexibility, and learning	Thematic Analysis	Structured interviews limit depth; ethnography difficult across countries
	Human-Centered Design Intervention	Participatory Mapping, Housing Journey Mapping, Co-Design Workshops, Future Scenarios	Test co-design and adaptive learning processes	Visual Coding, Interaction Analysis, Iterative Comparison	Focus groups generate discussion but do not design output; PAR may reduce analytical consistency
	Mixed-Methods Integration	Joint Displays	Connect household, governance, and HCD findings	Comparative Synthesis	Single-method analysis cannot explain governance-community interactions

WHY THIS METHODOLOGY?

CAPTURES GOVERNANCE + HOUSEHOLD + PARTICIPATION DYNAMICS
COMBINES MEASURABLE AND LIVED EXPERIENCES
ENABLES NORTH-SOUTH COMPARISON
SUPPORTS TRIANGULATION AND STRONGER VALIDITY
PRODUCES POLICY AND DESIGN RECOMMENDATIONS

WHY NOT OTHER METHODS?

QUANTITATIVE: MISSES LIVED REALITIES
QUALITATIVE: WEAK COMPARABILITY
ETHNOGRAPHY: DIFFICULT ACROSS TWO COUNTRIES
GROUNDING THEORY: THEORY GENERATION NOT OBJECTIVE
PAR ONLY: LIMITS ANALYTICAL DISTANCE

PROS

TRIANGULATION
CONTEXTUAL DEPTH
STRONG COMPARISON
HIGHER VALIDITY
POLICY RELEVANCE

CONS

TIME INTENSIVE
RESOURCE HEAVY
COMPLEX ANALYSIS
LARGE DATASETS
COORDINATION

The research argues that resilient transitional housing recovery is achieved not through institutional capacity or community adaptation alone, but through the continuous integration of governance learning and household knowledge via human-centered design processes.
